

Chem 452 - Lecture 3

Hemoglobin & Myoglobin

111007

Hemoglobin (Hb) and Myoglobin (Mb) function as oxygen transport and storage molecules in higher organisms. These functions have been long studied and, together, provide a wealth of examples of how the structure and function of proteins are related.

Allosteric Regulation

- Other allosteric regulators include
 - H^+ (lower pH) - The Bohr Effect
 - CO_2
- Both of these metabolites signal increased metabolic activity

Chem 452, Lecture 3 - Hb and Mb 2

Allosteric Regulation

- Other
- H^+ (lower pH)
- CO_2
- Both
- incre

Chem 452, Lecture 3 - Hb and Mb 2

Allosteric Regulation

- Other allosteric regulators include
 - H^+ (lower pH) - The Bohr Effect
 - CO_2
- Both of these metabolites signal increased metabolic activity

Chem 452, Lecture 3 - Hb and Mb 2

Allosteric Regulation

- Lower pH leads to the formation of salt-bridges (charge/charge interactions), that stabilize the T-state.
- α -chain α -amino group
- β -chain H146
- α -chain H122

Chem 452, Lecture 3 - Hb and Mb 3

Allosteric Regulation

- Lower pH leads to the formation of salt-bridges (charge/charge interactions), that stabilize the T-state.
- α -chain α -amino group
- β -chain H146
- α -chain H122

Chem 452, Lecture 3 - Hb and Mb 3

Allosteric Regulation

- Lower pH leads to the formation of salt-bridges (charge/charge interactions), that stabilize the T-state.
- α -chain α -amino group
- β -chain H146
- α -chain H122

Chem 452, Lecture 3 - Hb and Mb 3

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two different mechanisms.
- It lowers the pH

Chem 452, Lecture 3 - Hb and Mb 4

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two different mechanisms.
- It lowers the pH

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two different mechanisms.
- It lowers the pH

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two mechanisms.
- It lowers the pH
- It reacts with terminal α -amino groups

Chem 452, Lecture 3 - Hb and Mb 5

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two mechanisms.
- It lowers the pH
- It reacts with terminal α -amino groups

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two mechanisms.
- It lowers the pH

Allosteric Regulation

- CO_2 lowers Hb's affinity for O_2 by two mechanisms.
- It lowers the pH
- It reacts with terminal α -amino groups

Genetic Diseases Involving Hb

- Concept of diseases caused by molecular defect was proposed in 1949 by Linus Pauling
- Sickle-cell Hb (Hb-S)

Genetic Diseases Involving Hb

- Sickling of RBC's is caused by the aggregation (polymerization) of Hb molecules.

Genetic Diseases Involving Hb

- Sickling of RBC's is caused by the aggregation (polymerization) of Hb molecules

Chem 452, Lecture 3 - Hb and Mb 7

Genetic Diseases Involving Hb

- Sickling of RBC's is caused by the aggregation (polymerization) of Hb molecules.

Chem 452, Lecture 3 - Hb and Mb 7

Genetic Diseases Involving Hb

- Disease is caused by a substitution of a Val for a Glu at position 6 in the β -chain (E6V)

Chem 452, Lecture 3 - Hb and Mb 8

Genetic Diseases Involving Hb

- Sickle-cell disease is **homozygous recessive**.
- **Heterozygous** individuals do not express the disease
 - However, they are more resistant to the malaria parasite (*Plasmodium falciparum*)

Chem 452, Lecture 3 - Hb and Mb 9

Genetic Diseases Involving Hb

• Sickle-cell disease is **homozygous recessive**.

• **Heterozygotes** do not express the disease (they are carriers).
• However, heterozygotes have resistance to malaria.

Chem 452, Lecture 3 - Hb and Mb 9

Genetic Diseases Involving Hb

• Sickle-cell disease is **homozygous recessive**.

Chem 452, Lecture 3 - Hb and Mb 9
