The Similarity Principle in Drug Design - Lead Optimization is an Evolutionary Procedure

Medicinal chemists, all the time, used the similarity of chemical compounds to design new analogs of active leads. Whenever they discovered compounds with improved activity, selectivity, pharmacokinetics, etc., they used these compounds to search analogs with even further improved properties. However, ...

Isosteric Replacement of Atoms and Groups

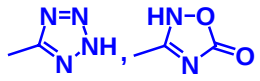
Substituents: F, Cl, Br, I, CF_3 , NO_2
Methyl, Ethyl, Isopropyl, Cyclopropyl, t.-Butyl,
-OH, -SH, $-NH_2$, -OMe, $-N(Me)_2$

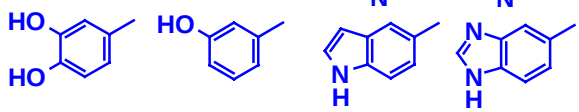
Linkers: $-CH_2-$, -NH-, -O-
$-COCH_2-$, -CONH-, -COO-
>C=O, >C=S, >C=NH, >C=NOH, >C=NOAlkyl

Atoms and Groups in Rings: -CH=, -N=
$-CH_2-$, -NH-, -O-, -S-,
$-CH_2CH_2-$, $-CH_2-O-$, -CH=CH-, -CH=N-

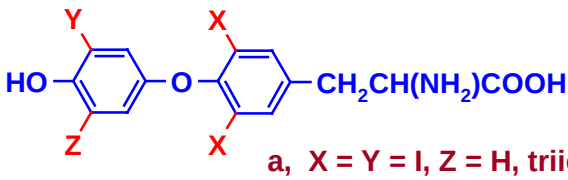
Large Groups: $-NHCOCH_3$, $-SO_2CH_3$

-COOH, -CONHOH, $-SO_2NH_2$,

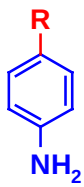




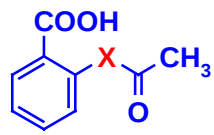
Consequences of Isosteric Replacement



a, X = Y = I, Z = H, triiodothyronine, T3
b, X = Y = Z = I, thyroxine, T4
c, X = I, Y = i-propyl, Z = H
d, X = CH_3, Y = i-propyl, Z = H



p-aminobenzoic acid,
R = COOH
sulfanilamide, R = SO_2NH_2



X = -O-
acetylsalicylic acid

Consequences of Isosteric Replacement

Inhibition of Carbonic Anhydrase by Sulfonamides

$CH_3SO_2NH_2$, K_i = 100 µM, pK_a = 10.5

$CF_3SO_2NH_2$, K_i = 2 nM, pK_a = 5.8

Specificity of GABA Receptor Ligands

Normal ECG

B. Fermini and A. A. Fossa, Nat. Rev. Drug. Discov. 2, 439-447 (2003)

University of Heidelberg

The QT Interval Prolongation Problem

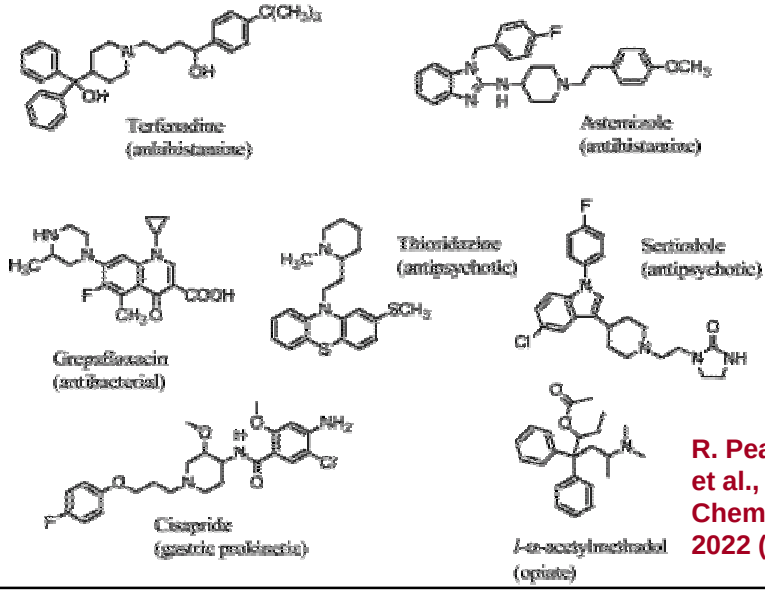
Many different drugs produce prolongation of the QT interval of the ECG (antihistamines, antipsychotics, antimicrobials, Ca antagonists …)

Several drugs have been withdrawn from the market and ~ 10% of drug candidates fail in development due to this problem, e.g. Terfenadine (Seldane™), Sertindole, Astemizole, ...

A typical reason for QT interval prolongation is the blockade of the cardiac hERG K+ channel by interaction of the drug with S6 domain of the protein.

Source: T. Langer, University of Innsbruck, Austria

Typical hERG Channel Inhibitors



R. Pearlstein et al., J. Med. Chem. 46, 2017-2022 (2003)

Prodrugs, Soft Drugs and Targeted Drugs

Prodrugs are inactive (less active) drug analogs that have better pharmakokinetic properties (e.g. oral bioavailability, BBB penetration)

Soft drugs are biologically active derivatives of inactive drug analogs; they are degraded to inactive analogs, e.g. esters of corticosteroid carboxylic acids, which are (topically) active.

Targeted drugs are drugs or prodrugs that exert their biological action only in certain cells or organs (e.g. Omeprazole, Aciclovir).

Voltaire, by J. A. Houdon

The Past

Voltaire (1694-1778):

**Doctors
pour drugs of which
they know little,
to cure diseases of which
they know less,
into human beings
of whom
they know nothing.**

The Future: Pharmacogenomics - New Opportunities from Personalized Medicine

Genotyping of drug targets and metabolic enzymes enables

- **cost savings in drug development through better design of clinical trials**
- **selection of the „best drug“ for a certain patient**
- **individual dose ranges (variance in target sensitivity, reduced or increased metabolism)**
- **fewer toxic side effects**
- **fewer unexpected drug-drug interactions**
